

Case Study: Care Home 1

Energy Reduction Campaign

Challenge

Care Home 1 provides facilities and services including Palliative care, Day care, Respite care, Convalescent care and Physiotherapy. The premises are maintained to a good standard however the equipment is old and inefficient. The focus was to reduce the client's energy costs and carbon footprint. Due to the type of business the home requires a constant heat demand.

Solution

Red1 Group Ltd collated site specific information regarding current energy consumption, usage, current equipment and running hours. With this information we were able to produce a proposal for the client outlining the offering and most importantly the savings.

The current boilers were installed in approximately 1978 and when new were 75% efficient.

The current lights on site were mostly standard filament or halogen fittings and a small amount of LED lamps

The home currently uses 36,000 kW of electricity on lighting and 840,000 kW of Gas. Red1 Group would install new boilers and LED lighting throughout the premises at no cost to the client.

Results

Red1 Group installed the new boilers and LED lighting with the following results.

Gas consumption reduced by approximately 30%

Electricity lighting consumption reduced by approximately 76%

The client will save over £32,000 in a 5 year period.

All of this was achieved with no cost to the client utilising Red1 Groups scheme.

If the client was to pay for the reduction scheme the total cost would be in excess of £38,000.

To find out how Red1 Group could cut your energy costs and reduce your carbon emissions please contact us.
